Abstract

*"IT Telkom Digital Bulletin Board Web-based Application" is an application that functions as a support for spread processing in*formati*on events in IT Telkom so it can be more effective and efficient and also helps the student to get in*formati*on based on category, cost, time, and place. Event in*formati*on is showed into a map and timeline. Where that map functions to show event based on location, while the timeline functions to show an event based on time. This application is integrated with a couple of social media such as facebook, twitter, and google+. This application can be used by students, student club, laboratory, lecture, faculty, institution, administrator.*

*The result of this final project is a web –based application that supports spread processing event in*formati*on in IT Telkom. This final project is built using Waterfall software development method. Using UML to document, specify, and modeling the system. Implemented using* PHP *language programming using* CodeIgniter *Framework also uses MySQL database and other software.*
